                                                                                                                                                                                                      /Gloue Ille Ille Indian Ille Coun. (ILLE COUL). A count of the library (bx) was normalized by self-subtraction. One portion of double stranded plasmid DNA representing the library was linearized by Not1. This Not1 digested library was used as a template for biotinylated RNA synthesis using SP6 RNA polymerase. Another portion of the double stranded plasmid library was converted to single-stranded circles in vitro using Gene II and Exonuclease III (Life Technologies). Single-stranded DNA (1 mg) was hybridized (COt 500) with 41 mg of Bio-RNA and vector blocking oligonucleorides. The hybridized Bio-RNA/ss-circles were removed by streptavidin:phenol extraction. EST analysis was performed on the library at the NIH Intramural Sequencing Center(NISC)."

// UI-E-C10 is a cDNA library.containing the following tissue(s): RPE and Choroid. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, eight en oligo-dT primer containing an Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I; and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligomoufsotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the contains the sequence that is located between the Not I site and the contains a library is

```
/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site 1: EcoR I; Site_2: Not I; NCI_CGAP_DHO is a cDNA library containing the following tissue(s): vS-8 cell line from Metastatic Chondrosarcoma in Lung. The library was constructed according to Bonaldo, Lennon and Soarce, Genome Research, 6:791-86, 1966, 1966, 1961 strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)lab tail. The sequence tag for this library is AGATCATTGC.

TAG_LIBSUE-H-DHO
TAG_LIB-UI-H-DHO

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6607879
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Susan G. Stuart
APPLICANT: Geffrey J. Seilhamer
TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF BLOOD CELL GENE
TITLE OF INVENTION: EXPRESSION
NUMBER OF SEQUENCES: 1508
CORRESPONDENCE ADDRESS:
ADDRESSES: INCTE PHARMACEUTICALS, INC.
STREET: 3174 PORTER DRIVE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be genericine and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone

Harbor, NY 11724, USA
On Jul 26, 2002 this sequence version replaced gi:16117547.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1-e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.

RP23-239M9 overlaps clone RP23-155E23 (AC093922) from base 1 to base 56914. The overlap is from base 53016 to base 109929 on

## ALIGNMENTS

ADH13940 standard; DNA; 150 BP.

RESULT 1

The invention relates to a novel nucleic acid molecule (I) comprising a sequence encoding monocyte-chemoattractant-protein-1 (MCP-1) or a protein having the biological activity of MCP-1. A protein encoded by a nucleic acid of the invention has cytostatic, and antiarteriosclerotic activity. A nucleic acid of the invention may have a use in gene therapy. A compound of the invention is useful in the preparation of a medicament for the treatment of atherosclerosis or cancer e.g. cervical carcinoma. A Novel nucleic acid molecule encoding monocyte-chemoattractant-protein-1, useful in gene therapy, for treating atherosclerosis and cancer. ds; human; monocyte-chemoattractant-protein-1; MCP-1; cytostatic; antiarteriosclerotic; gene therapy; atherosclerosis; cancer; cervical carcinoma. Human monocyte-chemoattractant-protein-1 related DNA SEQ ID NO:3. Poustka A; Delius H, Disclosure; SEQ ID NO 3; 30pp; English. identify a molecule or compound that specifically binds a cDNA of the invention. A protein encoded by the cDNA may be used to screen several molecules or compounds to identify a ligand that specifically binds to the protein, or to protein in a sample or purify a natural or the protein from a sample. The nucleotides may be useful for accombinant protein from a sample. The nucleotides may be useful for recombinant protein from a sample. The nucleotides may be useful for diagnosing, staging, treating, or monitoring the progression of treatment disease, hypertension, diabetes, pre-eclampsia, ischaemia-reperfusion circulary, restenosis, or stroke. The cDNAs can also be used for large-scale injury, restenosis, or stroke. The cDNAs can also be used for large-scale injury, restenosis, or stroke. The cDNAs can also be used for large-scale concerts or gene expression analysis of several new nucleic acid genetic or gene expression analysis of several new nucleic acid concerts. Antibodies to the proteins encoded by the cDNAs are useful for molecules. Antibodies to the proteins encoded by the cDNAs are useful for associated with abnormalities in the expression, amount or distribution confirmed protein. The present sequence represents a cDNA of the invention confirmed that is differentially expressed in activated vascular tissue. Note: The confirmed and in electronic format directly from USPTO at the present sequence deat and the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the confirmed the conf

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a combination comprising several cDNAs that are differentially expressed in activated vascular tissue. The invention also conscious a high throughput method for detecting differentially expressed consein a sample. The CDNAs in a semple, of the invention may have antiatretiosclerotic; cytostatic; cardiant; hypotensive; antidiabetic; gynaecological, vasotropic and cerebroprotective activities and may be used in gene therapy. The cDNAs of the invention may be used in a high-throughput methods for detecting differential expression of one or more throughput methods for screening several molecules or compounds to

comprising: (a) a sequence comprising at least 15 contiguous nucleotides of a sequence comprising variant sequences (A) from Table 4 given in the specification; or (b) a sequence that is complementary to (A). Also described: (1) an array of (PN) s comprising two or more of the isolated (PN) s; (2) detecting a (PN) in an individual; (3) a computer-readable storage medium, where each record has a field identifying a base occupying a (PN) site and a location of the polymorphic site; and (4) a signal carrying data for access by an application program having executed on a data processing system. The (PN) can be used for detecting loci associated with multiple sclerosis. ACF64025 to ACF6424 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 217 STCTTCTCCTGCCTGTTTTGCTTTTTCCTCATGACTCTTTTCTGCTCTTAAGATCAGA 276

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8418
                                                                                       This invention relates to a novel methods and animal models for testing candidate drugs that can be used for the treatment or prevention of agerelated macular degeneration (AMD). Specifically, it refers to administering a candidate drug to gene knockout mice, in particular CC12-deficient, Ccr2-deficient and/ or a Cc12-deficient/Ccr2-deficient dual knockout mouse eye for development or regression of drusen and/ or lipofuscin accumulation, as well as for the effect of a candidate drug on Bruch's membrane, retinal degeneration and/ or choroidal neovascularisation. Accordingly, such compositions exhibit ophthalmological activities and can be used for gene therapy purposes. This polynucleotide sequence is the human Cc12 gene and enchancer region DNA of the invention.

                     The invention relates to single nucleotide polymorphisms in the gene encoding human small inducible cytokine A2 (SCYA2) polypeptide. A method encoding human small inducible cytokine A2 (SCYA2) polypeptide. A method confront at the SCYA2 gene in a individual comprises identifying the for haplotyping at the copies of the gene is defined by one of the SCYA2 haplotypes given of the copies of the gene is defined by one of the SCYA2 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotypes. An association between a pairs can be assigned to specific genotypes. An association between a crait and a haplotype or haplotype pair of the SCYA2 gene can be trait and a haplotype pair in a reference population, where a higher haplotype or haplotype or haplotype or papilotype or papilotype or papilotype or papilotype or papilotype pair in a reference population, where a higher haplotype or haplotype or haplotype or papilotype pair. SCYA2 and its corresponding DNA are used for studying the expression and function of SCYA2, and in screening for candidate drugs to treat diseases related to SCYA2 activity, such as

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute mysloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

                                                                                        The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid reluxaemia, Alzheimer's disease, Alzheilepsy, neurofibromatosis, rheumatoid arthritis, psociasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                       genetic variants having polymorphisms in the small inducible cytokine (SCYA2) gene, useful for studying the function of SCYA2, and for ating disorders affected by expression or function of the SCYA2
                                                                                                                                                                                                                                                                                                                                                                                                    121
                                                                                                                                                                                                                                                                                                                                     61
 fragment of chemically modified gene, useful for of diseases associated with abnormal cytosine

concoding human small inducible cytokine A2 (SCYA2) polypeptide. A method for haplotyping the SCYA2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the SCYA2 haplotypes given the copies of the gene is defined by one of the SCYA2 haplotypes given in the specification or whether both copies are defined by a haplotype capair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the SCYA2 gene can be can a population exhibiting the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype cor haplotype pair. SCYA2 and its corresponding DNA are used for studying the expression and function of SCYA2, and in screening for candidate drugs to treat diseases related to SCYA2, and in screening for candidate drugs to treat diseases related to SCYA2, and in screening for candidate drugs to treat diseases related to SCYA2, and in screening for candidate drugs to treat diseases related to SCYA2, and in screening for sandidate drugs to treat diseases related to SCYA2, and in screening for sandidate drugs to treat diseases related to SCYA2 and in screening to shows the polymorphic sites in a uniform format to facilitate electronic searching of the SCYA2 haplotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by (GCA), by detecting the level of expression of comparing the DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are differential expression of Gs is indicative of GCA. Also included are modulating (MX) GA by contacting GC with an agent that alters the modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of a subject to a tissue, an allergic response in a subject, exposure of subject to a tissue, an allergic response in a subject, exposure of subject to a captones or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from GS, where the level

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is useful in the manufacture of a medicament for use in modulating the susceptibility to low BMD and/or bone damage. The disease associated with low BMD and/or bone damage is osteoporosis. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                       Gaps

or expression or the gene is indicative or intrammation; (w) treating cresponse in a subject, exposure of a subject to a pathogen or sterile ciresponse in a subject, exposure of a subject to a pathogen or sterile ciresponse in a subject, exposure of a subject to a pathogen or sterile ciresponse in a subject, exposure of a subject to a sterile inflammatory disease, by contacting a tissue having inflammation with an odetecting GGA, M2 is useful for modulating GA, M3 is useful for detecting an agent capable of modulating GCA preferably in a confinemation in a tissue; M4 is useful for detecting an inflammation in a tissue; M4 is useful for detecting an inflammation of inflammation in a tissue, an allergic response in a subject of exposure of a subject to a pathogen or sterile inflammatory disease (e.g. corditally chronic) in a tissue, an allergic response in a subject of septimation in a tissue, and allergic response in a subject of cardiac reperfusion injury, renal reperfusion injury, ARDS, adult of cardiac reperfusion injury, renal reperfusion injury, periodontal disease, alcerative collitis, periodontal disease; also bacterial of disease, ulcerative collitis, periodontal disease; also bacterial of unfection, that infection, parasitic infection, protozzal infection, fungal infection and M5 is useful for treating one of the above conditions. The present sequence represents a gene differentially not may art of the printed specification, but was obtained in clearnoic format directly from WHPO at this patent did electronic format directly from WHPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human;

The invention relates to polypeptides, comprising at least an optionally untated amino acid sequence AAG78184-AAG78187 and having c-kit gene promoter controlling activity, especially in mast cells. The polypeptides are useful in diagnosing disease associated with mast cells and controlling MITF (microphtsalmia-associated transcription factor) and the MITF gene, especially in mast cells. The present sequence is that of a MITF protein isoform encoding cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptides that control MITF and MITF gene in mast cells for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              87 TTCCTCATGACTCTTTTCTGCTCTTAAGATCAGAATAATCCAGTTCATCCTAAAATGCTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual data and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated but he invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

```
The invention relates to polypeptides, comprising at least an optionally mutated amino acid sequence AAG78184-AAG78187 and having c-kit gene promoter controlling activity, especially in mast cells. The polypeptides are useful in diagnoshing disease associated with mast cells and controlling MITF (microphtalmia-associated vith mast cells and HTF gene, especially in mast cells. The present sequence is that of a MITF protein isoform encoding cDNA
                                                                                                                                                               Polypeptides that control MITF and MITF gene in mast cells for use in a related medical area.

                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polypeptides, comprising at least an optionally mutated amino acid sequence AAG78184-AAG78187 and having c-kit gene promoter controlling activity, especially in mast cells. The polypeptides are useful in diagnosing disease associated with mast cells and controlling MITF (microphtalmia-associated transcription factor) and the MITF gene, especially in mast cells. The present sequence is that of a MITF protein isoform related DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         98
